Event Request & Booking System

Goal: Build a simple backend system where users can view events and send booking requests. Event organizers can accept or reject booking requests.

Requirements

- Create user registration and login using JWT authentication.
- Create two roles: `USER` and `ORGANIZER`.
- Allow organizers to create, update and delete events.
- Allow users to view available events.
- Add event fields such as title, description, date, location and capacity.
- Allow users to send a booking request for an event.
- Prevent users from sending duplicate booking requests for the same event.
- Allow organizers to view booking requests for their events.
- Allow organizers to accept or reject booking requests.
- Add booking statuses: `PENDING`, `ACCEPTED`, `REJECTED`, `CANCELLED`.
- Prevent bookings when the event capacity has been reached.
- Allow users to view their booking requests and current status.
- Allow users to cancel an accepted booking.
- Add pagination for events and booking requests.
- Add search for events by title.
- Add filtering by event date and booking status.
- Use MongoDB and Mongoose for data persistence.
- Organize the project using routes, controllers, services and models.
- Test all APIs and success/failure cases using Postman.
- Send an email when a booking request is accepted or rejected.
- Add event image upload using Cloudinary.
- Add refresh token and logout functionality.
